---

Hello,

I'm applying for the Chatbot Project Lead role.

The thing I'm actually interested in is how people talk to each other when something has gone wrong. I studied mass communication and wrote my thesis on cognitive biases in media, how persuasion works on people, and I've been chasing the same question ever since — just with landing pages and funnels instead of a paper. A support bot is that question at its sharpest, because the person on the other end is already annoyed and their money is involved.

For the last four years I've been building the part of an AI system that decides what it's allowed to say. At TripleTen I built the knowledge bases our agents pull from before they write anything — tone of voice, phrasings we allow, phrasings we don't, content rules — and the validation that checks the output before it goes out. A support bot needs the same thing, plus a clear line for when to stop and hand the person over to someone human.

I also lead a five-person distributed pod across time zones on two-week cycles. When I took it over, production was ad-hoc and the team was pulling in three directions. Now there's intake, priorities, handoffs and QA gates, and a release takes days instead of three or four weeks. I read the performance data myself and that's where the next version comes from.

Outside work I built ruah-tools.ai.studio, a set of tools for anxiety. Nobody asked me to, I wanted it to exist.

I haven't used Forethought, but prompting and guardrails are my daily work.

CV attached.
